

Platform governance as institutional custodianship: multi-actor collaboration in combating AI-enabled mis/disinformation

1. Introduction

This paper examines the governance of digital platforms in the face of unprecedented challenges posed by misinformation in the AI era. As key intermediaries in the flow of information and communication (Constantinides et al., 2018; Gawer, 2014), digital platforms bear significant responsibility for curbing the spread of false information, whether in the form of misinformation or disinformation (Cantarella et al., 2023; Qureshi & Bhatt, 2024). How we govern these digital platforms in a way that maintains institutional trust and limits the erosion of foundational institutions is an ongoing concern (Chen et al., 2022). We argue that resilient and trustworthy digital environment require collaborative multi-actor collaboration in integrating AI-driven solutions to foster institutional custodianship across digital platform ecosystems. We conclude by calling for future research that collaborates with practice and policy to explore innovative governance strategies that balance innovation with accountability in combating mis/disinformation and associated institutional decay through multi-actor collaboration.

2. Digital platforms and their governance

Digital platforms are essential to the modern digital economy, serving as standardized digital interfaces that facilitate interactions between diverse parties through modular cores, standardized interfaces, and complementary extensions (Chen et al., 2022; Mei et al., 2022). These platforms leverage digital technologies to organize and control digitized resources, creating value by connecting multiple stakeholders (sides) and benefiting from cross-side network effects. Effective communication on these platforms is essential for collaboration, bridging gaps between end-users, complementors and platform owners, and fostering an environment conducive to innovation and value creation.

Platform governance refers to both the governance by platforms of the activities they mediate and the governance of platforms' own strategies and design choices (Constantinides et al., 2018; Gillespie, 2017). Governance strategies adopted by platforms aim to mitigate conflicts and align objectives across their multiple sides. They often rely on digital and administrative tools that facilitate and control interactions within platform ecosystems. These strategies enhance coordination among stakeholders (Chen et al., 2022; Halckenhäusser et al., 2020; Mei et al., 2022), such as users, service providers, and advertisers (Gorwa, 2019). Platform owners oversee and regulate their participants' interactions and encourage desirable behaviors through mechanisms such as decision rights allocation, control levels, and the management of proprietary versus shared ownership (Mei et al., 2021; Halckenhäusser et al., 2020). Rather than relying on hierarchical control, platform governance orchestrates complementors' activities by combining mutual adjustments and formal control.

The strategies and technologies through which platforms govern the behavior of their participants are themselves governed through various societal mechanisms (Gillespie, 2017). Since the rise of digital platforms as a dominant form of organizing economic and social interactions, concerns over their growing economic and epistemic power have led government, non-government, and international organizations to adopt regulations and policies that can influence their strategic choices and establish the extent of their liability (Gorwa, 2019).

As digital platforms continue to dominate global communication and commerce, robust governance by and of platforms is critical to mitigating risks that are amplified by AI such as misinformation, disinformation, and security threats (Arora et al., 2023). The

challenge lies in developing governance structures and practices that account for the evolving nature of these risks while balancing openness and control, fostering innovation, and preventing harmful content dissemination.

3. Mis/disinformation, social media, and AI

Misinformation refers to false or misleading information spread without intent to deceive, whereas disinformation is deliberately false information designed to mislead (Li & Chang, 2023). Disinformation is often weaponized to influence public opinion, discredit opponents, and manipulate elections. AI exacerbates mis/disinformation through personalization, amplification, and content generation. First, AI enables large scale personalization of misinformation messages (Kreps, 2020). The availability of large amounts of user data allows AI models to direct (mis)information to the most receptive audiences. Second, AI amplifies misinformation by automated dissemination (Monteith et al., 2024) utilizing social bots that engage with real users and increase exposure to false narratives (Hajli et al., 2022). Algorithmic amplification further prioritizes engagement-driven, often sensationalized, misinformation. Finally, AI enhances deceptive content, making false information more convincing through deepfakes and synthetic media.

3.1. The double-edged sword of generative AI

The advent of generative AI tools marks a revolutionary shift in how individuals and businesses access information and engage with content. These technological innovations have unlocked unprecedented gains in productivity (Noy & Zhang, 2023). No longer restricted to technology experts, these tools are now available to anyone having an Internet access, empowering users to unleash their creativity and create content without technical barriers. A UNESCO¹ supported report, underscores the myriad opportunities generative AI presents, from enhancing tutoring experiences to fortifying journalistic tools and creating diverse content such as presentations, computational tools, code and artwork.

Generative AI holds particular promise for elections, enhancing civic engagement and education by summarizing policies, improving voting advice applications, and facilitating communication between citizens and lawmakers (Moura et al., 2025). It can also empower under-resourced campaigns by refining outreach and communication strategies. However, generative AI is also increasing the scale, sophistication, and personalization of disinformation campaigns. The emerging affordances of generative AI are lowering the cost of crafting mis/disinformation, enabling campaigns to drown out alternative content (Marcus, 2023). They also elevate the quality and persuasive power of disinformation messages (Danry et al., 2025). In addition, the ability of generative AI to replicate communication styles allows the creation of more targeted disinformation messages (Benson, 2023). While the effectiveness of these strategies is still a matter of debate and depends on the continued development of generative AI tools (Simon et al., 2023), the consequences for society are significant enough to warrant careful analysis of how AI-enabled mis/disinformation are further influencing social structures and processes.

3.2. Combating AI-enabled mis/disinformation through institutional custodianship

The societal consequences of misinformation and disinformation are evident in their effect on institutions as the building blocks of society. The spread of mis/disinformation is resulting in the decay of critical institutions underlying political, social, and economic systems. Institutional decay, or institutional entropy, is the gradual erosion of an institution's legitimacy, effectiveness, and structural integrity due to prolonged neglect, lack of maintenance, and diminishing resources (Montgomery & Dacin, 2020). Misinformation contributes to and accelerates institutional decay by eroding trust in traditional information sources, undermining the legitimacy of democratic and economic processes, fragmenting the public discourse, and weakening shared norms and values (Au et al., 2022; Roberts & Qahri-Saremi, 2023).

Online misinformation delegitimizes long-established democratic institutions, such as electoral processes through, for example, the spread of conspiracy theories about voting fraud (Ecker et al., 2024). Similarly, in financial markets, the increasing prevalence of false financial information generates market distortions, panic selling, and reduced investor confidence (Akerlof & Shiller, 2010). Misinformation also fragments public discourse, creating ideological echo chambers that deepen societal divisions and hinder consensus on basic facts (Fraser, 2023).

Slowing down the institutional decay spurred by AI enabled mis/disinformation requires institutional work that maintains the institutions being eroded and creates new institutions that strengthen the integrity and resilience of the public sphere. In an AI age, this institutional work is increasingly entangled with the materiality of digital technologies, as technology affordances become integral to the logics that shape institutional processes (Faik, Barrett, Oborn 2020, Oborn et al., 2021). Further, and equally important, this institutional work requires *institutional custodianship* across multiple domains of social life. Institutional custodianship is the active work of individuals, groups, and organizations who maintain institutions (Dacin et al., 2019). While institutions are, by definition, social structures that extend in time, their continuity and stability are not a given; rather, they require deliberate work by institutional custodians. This can take the form of actions, as in institutional work that reinforce existing rules (Lawrence & Suddaby, 2006) use physical spaces as stabilizing artifacts of institutions (Czarniawska, 2009; Siebert et al., 2017), build on heightened emotions, even resort to violence, to defend a threatened institution (Crawford & Dacin, 2021), or make institutions more accommodating of changing

¹ Dr. Rumman Chowdhury, Dhanya Lakshmi, UNESCO, "Technology-Facilitated Gender-Based Violence in an Era of Generative AI", World Trends in Freedom of Expression and Media Development Series, November 2023.

practices (Lok & de Rond, 2013). In the age of AI, custodial work often targets the institutional dynamics of algorithms to address the threat they pose to the stability of established institutional arrangements. One approach to this form of institutional work is in constructing a boundary, or an “envelope,” around algorithms as a means to controlling their impact (Marti et al., 2024). Platform governance is a critical space for enacting such custodianship efforts. Such custodial work promotes guardianship (Lok & de Rond, 2013) of existing institutions to combat their decay and often involves a reinvention and renewal of meaning through multi-actor collaboration (Kuenkel, 2024; Mukhopadhyay & Bouwman, 2018) across a wide range of stakeholders globally.

To explore and illustrate these ideas, we now draw on the recent development by UNESCO of multi-actor collaboration across stakeholders globally for platform governance. We subsequently conclude by reflecting on these concepts and the implications for promoting institutional custodianship in combating AI-enabled mis/disinformation through multi-actor collaboration.

4. Custodial work by UNESCO in promoting guidelines for platform governance

Over the last several years, a fragmented global landscape of regulations has gradually emerged to address misinformation, hate speech, and conspiracy theories. Unfortunately, there is no unified regulatory guidance, and many countries have implemented measures which often jeopardize civic spaces. From poorly crafted regulations to extreme extra-legal actions like Internet shutdowns, the response has been diverse. In a bid to rectify this and nurture an “Internet for trust”, UNESCO unveiled Guidelines for the Governance of Digital Platforms, promoting a comprehensive framework for a safer, more secure and trustworthy online sphere.

UNESCO operates on the fundamental principle that maintaining an enabling environment for freedom of expression, access to information, and other human rights is a shared responsibility among all stakeholders. This commitment extends to fostering an open, safe, and secure digital environment for both users and non-users. The Guidelines embody a multi-stakeholder approach, initially set in motion during the 2005 World Summit on the Information Society (WSIS) and reaffirmed by the UN General Assembly in 2015. Crafted through extensive engagement since May 2022, involving stakeholders worldwide—ranging from Member States, digital platforms as well as intergovernmental and civil society organizations to media, academia, the technical community, and diverse voices from groups in situations of marginalization and vulnerability—the Guidelines prioritize inclusivity. By adopting this comprehensive approach, UNESCO emphasizes that the governance of digital platforms transcends the purview of governments or platforms alone; it is a matter that concerns society at large, warranting broad consultation.

The formulation of UNESCO’s Guidelines is grounded in three global and open consultations, which garnered over 10,000 comments from 134 countries. The third consultation, held in Paris in February 2023 at UNESCO’s Headquarters during the “Internet for Trust” conference,² gathered more than 4000 stakeholders. Participants included representatives from Member States, media, civil society, academia, the technical community and major digital platforms such as Meta, Google, TikTok, and Twitter/X. In addition to being inclusive, UNESCO’s approach was rigorous. Over 800 documents on digital platform management were scrutinized, existing regulations were mapped, and insights from whistleblowers and journalists specializing in digital technologies were collected. This extensive consultation effort represents one of the broadest ever conducted by any United Nations organization.

The UNESCO Guidelines transcend mere principles; they constitute a call for action, urging safeguarding freedom of expression and access to information on digital platforms. They establish a comprehensive framework that delineates the responsibilities and roles of each stakeholder. Regarding digital platforms, the Guidelines articulate five fundamental principles to which platforms must comply: (1) Platforms should conduct human rights’ due diligence, assessing their impact on human rights, including the gender and cultural dimensions, evaluating the risks, and defining mitigation measures; (2) Platforms should adhere to international human rights’ standards, including in platform design, content moderation, and content curation – such as the UN Guiding Principles on Business and Human Rights; (3) Platforms should be transparent and open regarding the way they operate, with understandable and auditable policies as well as multistakeholder-designed metrics for performance evaluation; (4) Platforms should make information accessible for users to understand the different products, services, and tools provided, and to make informed decisions about the content they share and consume; (5) Platforms should be accountable to relevant stakeholders—including users, the public, and actors within the governance system—about the implementation of their terms of service and content policies.

4.1. Multi-actor collaboration & institutional custodianship for platform governance

UNESCO’s guidelines suggest that addressing misinformation requires a global multi-stakeholder collaborative approach to platform governance. Effective governance frameworks must integrate regulatory frameworks that hold platforms accountable for content moderation, technological solutions such as AI-driven moderation and detection tools, as well as community engagement through digital literacy initiatives that empower users in identifying misinformation.

Digital platform governance requires custodians who carry out custodial work through deliberate coordination of multiple actors in shaping the rules that govern content generation and dissemination in the online sphere. Given their increasing economic power and social influence, digital platforms require decentralized yet coordinated governance models. For example, UNESCO’s multi-stakeholder governance model relies on shared responsibility among platform companies, policymakers, and the public. Such governance models create opportunities for distributed institutional custodianship, where multiple stakeholders actively engage in sustaining the integrity of critical institutions (Crawford & Dacin, 2021).

Thus, maintaining a healthy information environment in the age of AI requires public-private collaborations, including alliances

² About the “Internet for Trust” conference, 21 to 23 February 2023. <https://www.unesco.org/en/internet-conference>

among governments, tech firms, and academia, to develop countermeasures against AI-amplified misinformation. Multiple and diverse stakeholders need to actively engage in custodianship efforts through the orchestration of a system of trust in which the responsibility and accountability for the spread of misinformation are delineated. Research on institutional custodianship shows that it “can be claimed by ordinary citizens, motivated by their deep connection to and guardianship of an institution’s integrity” (Crawford & Dacin, 2021, p. 1219). Therefore, the custodianship of the various institutions threatened by misinformation cannot be limited to platform owners, governments, or civil society organizations; it needs to build on an ecosystem that brings together the interests of all these entities and coordinates their diverse approaches to governance.

The domains of such distributed institutional custodianship include the design of the algorithms underlying the technological infrastructure through which public information flows, the governance of the data feeding the AI models, the dignity of both the consumers and the subjects of informational content, the power relations that shape access to and control over critical information, and the legal frameworks that assign responsibility and accountability for the spread of misinformation. Institutional actions in all these domains need to be open to diverse stakeholders to create effective governance models that can maintain critical institutions and create, even reinvent, new ones that support social and economic wellbeing.

5. Platform governance for institutional custodianship: future implications for research, policy, and practice

As AI-enabled mis/disinformation becomes increasingly sophisticated and pervasive, the governance of digital platforms emerges as a critical arena for safeguarding institutional integrity, limiting institutional entropy, and promoting resilience. Yet, the literature on mis/information has so far largely focused on understanding how individuals cognitively encounter and assess mis/disinformation, with experiments being the method of choice in developing that understanding (c.f. Hwang & Lee, 2025; Kim & Dennis, 2019; Moravec et al., 2020). There is a need for more theoretical and empirical attention to the institutional dimension of the phenomenon, particularly as it relates to the emerging challenges created by the increasing use of AI by digital platforms and their users. In this regard, we propose the approach of institutional custodianship to AI-enabled mis/disinformation by governing platforms through multi-actor collaboration. Such an avenue of exploration for future work could fruitfully examine several research questions, including: How does the integration of AI into our information landscape affect institutional decay?, what forms of multi-actor collaboration in digital platform ecosystems might enable the custodianship of valued institutions?, what custodial roles (Montgomery & Dacin, 2020) should the different actors (e.g. regulators, platforms, complementors, users) play in distributed custodianship frameworks?, how do envelopes that allow algorithms to function while controlling their inputs and outputs, or their absence, affect the trustworthiness and resilience of our information landscape?, and what coordination mechanisms and strategies may sustain effective platform governance and preserve information integrity in the digital space? We believe that to address these and other related research questions will require an interdisciplinary research agenda across information systems (e.g. on digital platforms and ecosystems) and organizational (e.g. institutional custodianship) and management theory (e.g. governance and multi-actor collaboration). Such work should develop theoretically meaningful work with rich insights and concepts as well as actionable frameworks that bridge research, policy, and practice.

As discussed, recent initiatives spearheaded by UNESCO illuminate promising directions for understanding multi-actor collaboration and custodianship for governing digital platforms. More recently, the June 2024 global regulators’ conference in Dubrovnik and the establishment of the Global Network of Regulatory Networks reflect a growing commitment to regional contextualization of governance principles and the importance of cross-border policy alignment. Meanwhile, the Internet4Trust Global Knowledge Network signals a new era of institutional custodianship, where an independent, multi-disciplinary group provides expertise on digital platforms in ways that foreground human rights and democratic values. UNESCO’s expanding role, including its stewardship of the climate-focused Information Integrity initiative announced during the 2024 G20 summit, underscores how digital platform governance is increasingly interwoven with global challenges like climate change.

The institutionalization of these efforts through the Global Digital Compact (GDC), adopted by UN Member States in September 2024, highlights the fact that platform governance is no longer the sole domain of state actors or private owners of digital platforms. Rather, it needs to be a shared project at the societal and global level. The GDC’s focus on transparency, accountability, and user empowerment reinforces a key point of our paper, namely that institutional custodianship must be both distributed and deliberate, encompassing algorithmic design, governance and accountability, as well as civic empowerment.

Moving forward, governance strategies must be evaluated not only by their regulatory rigor but by their ability to foster pluralistic, inclusive, and resilient environments on digital platforms. This will require ongoing experimentation as we have seen with UNESCO with innovative coordination mechanism, such as hybrid regulatory models, civic observatories, or algorithmic auditing protocols as well as a sustained commitment to ethical innovation. As our paper portrays with its multidisciplinary authorship, the future of digital platform governance similarly requires multi-actor collaboration bridging research, policy, and practice if we are to stem the tide of institutional decay and promote digital resilience of our valued institutions in an AI age.
