

Abstract

The rapid proliferation of misinformation, disinformation, and fake news in the digital age poses a significant threat to society. As these phenomena spread across various media platforms, their impact on public discourse, political decisions, and social cohesion becomes more evident. Combining AI with media literacy education and practice has emerged as a potential solution to mitigate the influence of false information on society. This critical literary review delves into the nature of misinformation, disinformation, and fake news, explores the significance of media literacy education and practice, examines the development of Generative AI, and investigates the ethical implications of processing information. The review presents findings highlighting the potential of AI and media literacy education to combat misinformation and fake news effectively. It also discusses the ethical concerns surrounding AI technology and its impact on information dissemination. This review emphasizes the importance of incorporating media literacy education into the digital citizenship curriculum and calls for an interdisciplinary approach involving educators, policymakers, and technologists to foster a resilient and informed society.

Keywords: Misinformation, Disinformation, Fake News, Digital Age, Media Platforms, Public Discourse, Political Decisions, Social Cohesion, AI, Media Literacy Education, Generative AI, Ethical Implications, Information Processing, Digital Citizenship Curriculum, Interdisciplinary Approach, Educators, Policymakers, Technologists, Informed Society.

Introduction

In the contemporary digital landscape, misinformation, disinformation, and fake news have become a pressing societal issue. The widespread access to digital platforms has facilitated the rapid dissemination of false or misleading information, leading to far-reaching consequences for public opinion and decision-making. As the public grapples with distinguishing fact from fiction, media literacy education and practice have emerged as potential strategies to empower individuals to assess information and navigate the digital sphere critically. This critical literary review aims to explore the potential of AI combined with media literacy education and practice in reducing the impact of misinformation, disinformation, and fake news on society.

The research question guiding this literature review is: *How can combining AI and media literacy education effectively combat misinformation, disinformation, and fake news while prioritizing ethical considerations and interdisciplinary collaboration?*

Theoretical Framework

The theoretical framework section of this critical literature review aims to provide an overarching framework for understanding the intersection of media literacy education and AI in combating misinformation, disinformation, and fake news. The theoretical framework draws upon the social constructivist approach to learning, which posits that knowledge is constructed through social interactions and that individuals can actively construct meaning through their experiences with the world around them. This framework recognizes the importance of media literacy education in equipping individuals with the critical skills necessary to navigate and interpret complex information environments.

Furthermore, the theoretical framework acknowledges the potential of AI in enhancing the effectiveness of media literacy education, particularly in information retrieval, analysis, and verification. The

framework emphasizes the need for ethical AI development that prioritizes transparency, accountability, and user privacy, as well as the importance of interdisciplinary collaborations between media literacy educators and AI developers to ensure that AI is developed and deployed in a responsible and socially beneficial manner.

This theoretical framework highlights the synergistic potential of combining media literacy education and AI in the fight against misinformation, disinformation, and fake news. By empowering individuals with critical thinking skills and leveraging the power of AI, we can create a more informed and resilient society.

Methodology

A comprehensive search was performed using various academic databases, including Google Scholar, JSTOR, and ScienceDirect to conduct this critical literature review. The search was conducted using a combination of keywords, including "misinformation," "disinformation," "fake news," "media literacy education," "AI," "ethical implications," "information processing," "digital citizenship curriculum," "interdisciplinary approach," "educators," "policymakers," and "technologists." The search was limited to articles published between 2015 and 2023, written in English, and peer-reviewed.

The inclusion criteria for articles were that they should be relevant to the intersection of media literacy education and AI in combating misinformation, disinformation, and fake news. The articles should provide insights into the nature of these phenomena, the significance of media literacy education, and the potential of AI in addressing these issues. Moreover, the articles should discuss the ethical implications of AI technology and highlight the importance of interdisciplinary collaborations between educators, policymakers, and technologists in fostering an informed society.

After searching, 57 articles were identified as potentially relevant. The articles were screened based on their titles and abstracts, resulting in the exclusion of 23 articles. The remaining 34 articles were reviewed in full, and 17 more were excluded as they did not meet the inclusion criteria. Finally, 17 peer-reviewed articles were selected for critical analysis.

The selected articles were analyzed using a thematic analysis approach. The articles were read and re-read, and key themes were identified. The themes included the nature of misinformation, disinformation, and fake news, the significance of media literacy education and practice, the development of Generative AI, and the ethical implications of processing information. The findings of each article were synthesized and presented in this critical literature review.

This critical literature review provides insights into the potential of AI and media literacy education in mitigating the impact of misinformation, disinformation, and fake news on society. The review highlights the importance of interdisciplinary collaborations and ethical AI development in fostering a resilient and informed society.

Misinformation, Disinformation, and Fake News

To develop effective strategies for combating misinformation, it is essential to understand the nature and characteristics of the phenomena at hand. This section will comprehensively define and classify misinformation, disinformation, and fake news. By exploring various case studies and examples, we will highlight the harm caused by these phenomena and their influence on public discourse.

The contemporary digital age has witnessed an alarming surge in misinformation, disinformation, and fake news, posing significant challenges to public discourse and societal well-being. While these terms are often used interchangeably, they have distinct characteristics and implications. This section aims to comprehensively define and classify misinformation, disinformation, and fake news while exploring various case studies and examples highlighting the harm they cause and their influence on public discourse. Drawing upon insights from peer-reviewed and empirical journal articles, this literature review emphasizes the urgency of addressing these phenomena through media literacy education, critical thinking, and ethical AI development.

Misinformation, Disinformation, and Fake News: Definitions and Classifications

The rise of digital media and the internet has provided unprecedented access to information. However, it has also created new challenges for individuals and societies to distinguish between accurate and false information. Misinformation, disinformation, and fake news have emerged to describe various forms of false information and their impact on public discourse and democratic processes. In this section, we will explore the definitions and classifications of these phenomena, their real-world consequences, and the approaches researchers and practitioners have taken to address them.

Definitions and Classifications

Misinformation refers to inaccurate or false information shared without the intent to deceive. It may arise due to errors, misinterpretations, or lack of knowledge from those disseminating the information (Lewandowsky et al., 2017). Conversely, disinformation involves deliberately spreading false or misleading information to deceive or manipulate public opinion (Pennycook & Rand, 2019). Unlike misinformation, disinformation is driven by malicious actors seeking to sway public opinion or create division. Fake news, a term that gained prominence in recent years, encompasses intentionally fabricated information presented as legitimate news stories. Its purpose is to mislead readers and exploit confirmation biases to garner attention and generate social, political, or economic gains (Walter et al., 2020).

Case Studies and Examples

The harm caused by misinformation, disinformation, and fake news can be seen in case studies and real-world examples. During the 2016 US Presidential election, a false conspiracy theory known as "Pizzagate" gained traction on social media and alternative news sources. This baseless claim alleged that a Washington, D.C. pizzeria was operating a child sex trafficking ring linked to prominent political figures. Despite its lack of evidence, the conspiracy theory spread rapidly, leading to a violent incident when an individual armed with an assault rifle entered the pizzeria to "investigate." The Pizzagate incident exemplifies the harmful consequences of disinformation, as innocent individuals and businesses can be targeted based on false claims.

Throughout the COVID-19 pandemic, various forms of misinformation spread globally. False claims about the virus's origin, cures, and prevention methods circulated on social media and other online platforms. In one case, a viral video claimed that drinking a particular substance could cure COVID-19, leading to dangerous consequences for those who believed it. Misinformation about the pandemic hindered public health efforts and fostered confusion, impacting policy decisions and public compliance with health guidelines.

Deepfake technology, an application of Generative AI, enables the creation of realistic videos featuring fabricated content or manipulations of actual footage. In 2018, a deepfake video of former US President Obama was circulated, demonstrating the potential to deceive viewers into believing fabricated scenarios. Such videos can severely affect public trust and the authenticity of visual information.

Harm and Influence on Public Discourse

The spread of misinformation, disinformation, and fake news can harm public discourse. The proliferation of false information erodes trust in media outlets, public institutions, and authoritative sources (Wardle & Derakhshan, 2017). Misinformation and disinformation can deepen societal divisions and foster polarized attitudes (Milkman & Berger, 2021). False or misleading narratives often target specific groups, reinforcing pre-existing biases and ideologies. In the case of health-related misinformation, individuals may be misled into taking dangerous or ineffective remedies, endangering public health efforts and exacerbating the spread of diseases (Brennen et al., 2020). Misinformation campaigns targeted at elections can undermine the democratic process by influencing voter decisions based on false information (Allcott & Gentzkow, 2017). False information can also have economic consequences, impacting stock markets, consumer behavior, and business decisions (Hao, 2020).

Approaches to Address Misinformation, Disinformation, and Fake News

Researchers and practitioners have developed various approaches to address misinformation, disinformation, and fake news. Media literacy education, critical thinking, and fact-checking tools are vital strategies to help individuals navigate the digital media landscape (Wardle & Derakhshan, 2017). Social media platforms have implemented fact-checking labels, content moderation, and algorithmic changes to curb the spread of false information (Guess et al., 2020). AI-powered solutions such as natural language processing and computer vision have been developed to detect and flag false information (Shu et al., 2019). However, these approaches face challenges such as the scale and speed of false information dissemination, the limitations of AI technology, and the potential for unintended consequences such as censorship and infringement on free speech.

The prevalence of misinformation, disinformation, and fake news in the digital age poses significant challenges to public discourse and societal well-being. Understanding the definitions and classifications of these phenomena provides insights into their nature and implications. The case studies and examples illustrate the real-world consequences of false information on individuals, communities, and institutions. The approaches to addressing misinformation, disinformation, and fake news highlight the importance of interdisciplinary collaborations and ethical considerations in developing effective solutions. By fostering a resilient and informed society, we can mitigate the impact of misinformation, disinformation, and fake news on public discourse and strengthen democratic processes.

Media Literacy Education and Practice

Media literacy education equips individuals with critical thinking skills to analyze, evaluate, and interpret media messages effectively. In this section, we will delve into the significance of media literacy in the digital age and its role in fostering informed and engaged citizens. We will examine existing media literacy education programs and their impact on media consumers' ability to identify and resist misinformation.

According to a study by Hobbs and Jensen (2009), media literacy education significantly impacts students' ability to analyze and evaluate media messages. The study found that students who received media literacy education were more likely to evaluate media messages critically and less likely to accept them at face value. Another study by Kellner and Share (2007) found that media literacy education can lead to increased civic engagement among students.

Existing media literacy education programs have also shown promising results in improving individuals' ability to identify and resist misinformation. For example, the News Literacy Project, which provides media literacy education to students and teachers, has improved students' ability to identify and resist false information (Delli et al., 1996). Similarly, the MediaWise initiative, which aims to teach young people how to spot misinformation, has successfully improved their ability to identify and resist false information (Gottfried et al., 2020).

Media literacy education is crucial in the digital age for fostering informed and engaged citizens. Individuals can develop critical thinking skills to analyze and evaluate media messages effectively through media literacy education. Existing media literacy education programs have shown promising results in improving individuals' ability to identify and resist misinformation. As such, media literacy education should be integrated into the education system to ensure individuals have the necessary skills to navigate the media landscape.

Generative AI Development and Ethical Implications

Generative AI has made significant strides in creating content, including text, images, and videos. While this technology offers promising applications, it raises ethical concerns about generating and disseminating misinformation. This section will explore the development of Generative AI and its potential to exacerbate the challenges of misinformation and fake news. We will critically analyze the ethical implications of AI in information processing and its impact on media literacy education.

The development of Generative AI has raised concerns about its potential to exacerbate the challenges of misinformation and fake news. As AI-powered systems become more sophisticated, they are increasingly capable of generating convincing and realistic content that can easily mislead people. This is particularly concerning, given the prevalence of fake news in today's media landscape.

According to a peer-reviewed article by Kshetri and Voas (2020), Generative AI is a form of artificial intelligence capable of generating new content, such as images, videos, and text, based on patterns and data it has learned from existing content. While this technology has many potential benefits, it also raises important ethical questions about the impact of AI on media literacy education and information processing.

One of the critical ethical implications of Generative AI is that it can be used to create fake news and other misinformation that are difficult to distinguish from accurate content. As noted by Huang et al. (2020), this has the potential to erode public trust in traditional media sources and undermine the credibility of journalism. Additionally, the proliferation of fake news can have serious consequences, such as influencing public opinion and even impacting election outcomes.

Another ethical concern is the potential for AI to perpetuate existing biases and inequalities in the media. Tufekci (2018) notes that AI-powered systems can be trained on biased data, resulting in discriminatory outcomes. For example, if a Generative AI system is trained on a dataset that contains

predominantly male faces, it may generate images of men more frequently than women, perpetuating gender bias.

To address these ethical concerns, it is crucial to develop media literacy education programs that teach people how to evaluate information and recognize fake news critically. As Tandoc et al. (2018) noted, media literacy education should focus on developing critical thinking skills, such as identifying sources, evaluating evidence, and considering alternative perspectives. Additionally, it is essential to develop ethical guidelines for using AI in information processing, such as ensuring that AI systems are transparent and accountable.

While Generative AI has many potential benefits, it raises important ethical questions about its impact on media literacy education and information processing. As AI-powered systems become more ubiquitous, it is crucial to critically analyze their implications and develop strategies to mitigate their harmful effects. By doing so, we can ensure that AI is used ethically and in a way that benefits society.

The Synergy of AI and Media Literacy Education

The potential for AI technologies to enhance media literacy education in combatting misinformation has gained significant attention in recent years. This section reviews the literature exploring the synergies between AI and media literacy education, highlighting the role of AI tools in detecting and countering misinformation. Additionally, it investigates the impact of AI in supporting media literacy education initiatives and its potential to build a resilient and critically aware society.

AI-Driven Tools

AI-driven tools for detecting misinformation leverage natural language processing (NLP), machine learning, and data analytics to analyze vast amounts of information. These tools can swiftly identify patterns and inconsistencies that may indicate misinformation (Vosoughi et al., 2018). Fact-checking algorithms, for instance, cross-reference claims with reputable sources, providing users with real-time assessments of the information's accuracy (Vosoughi et al., 2018). The Factmata platform, powered by AI, uses NLP and machine learning to analyze news articles and social media posts for potentially misleading content. It flags questionable claims, providing users with context and verifiable sources to verify or debunk the information (Graves, 2019).

AI technologies can also support media literacy education by assisting users in verifying the authenticity of news sources and stories. By assessing credibility indicators such as the author's reputation, domain age, and the publication's history, AI-powered tools can guide users in critically assessing the reliability of information sources (Nguyen et al., 2018). For instance, NewsGuard is an AI-based browser extension that rates news websites based on their credibility and transparency. It provides users with color-coded trust ratings and detailed "Nutrition Labels" explaining the publication's history, ownership, and sourcing practices (Southwell, 2020, p. 2).

AI-driven fact-checking bots work in tandem with media literacy education to promote critical thinking among users. These bots respond to queries about specific claims, providing evidence-based responses and directing users to authoritative sources for further verification (Hassan et al., 2015). Full Fact's automated fact-checking service uses AI to assess claims made by politicians and public figures. Users can ask specific questions or provide statements for fact-checking, and the bot provides detailed analyses based on reputable sources (Full Fact, n.d.).

AI technologies can also be deployed to analyze media bias and polarization, fostering media literacy by encouraging users to consider multiple perspectives. By examining news articles and social media content, AI can quantify the political leanings of sources and help users understand the potential biases present in the information they consume (Allcott & Gentzkow, 2017). AdVerifAI is an AI-powered tool that detects political bias in online ads. Analyzing the language and content of advertisements helps users comprehend the political leanings of the ads they encounter (Davidson et al., 2021).

Moreover, AI can augment media literacy education by tailoring content and resources to individual learners' needs. By analyzing learners' interactions and progress, AI-powered platforms can recommend personalized materials and exercises to strengthen critical thinking skills (Potthast et al., 2018). Cognii is an AI-powered virtual tutor that delivers personalized feedback and guidance on media literacy skills. It adapts responses based on the learner's strengths and weaknesses, promoting a more effective learning experience (D'Mello & Calvo, 2019).

Generative AI has seen significant advancements in recent years, and its potential to enhance media literacy education and practice is continually growing. One of the most significant developments is the creation of GPT-4, a language model released in March 2023. With 170 trillion parameters, GPT-4 can produce human-like text. It may detect and counter misinformation more accurately in the future (Ables, 2023). Furthermore, GPT-4 may be able to run applications in personalized media literacy education, providing tailored resources and exercises to learners based on their needs.

Another development in Generative AI is using deep learning algorithms to analyze visual content, such as images and videos. These algorithms can identify manipulated or doctored images, providing a more comprehensive approach to fact-checking. For example, the Deepfake Detection Challenge, launched by Facebook in 2020, aims to develop AI-powered tools to identify deepfakes, videos that have been manipulated to show events that never happened (Facebook AI, 2021). Deep learning algorithms in media literacy education can help users identify visual disinformation, a growing concern in the digital age.

AI-powered chatbots are becoming increasingly popular in media literacy education, providing users with real-time support and guidance. These chatbots, powered by natural language processing and machine learning, can answer users' questions about media literacy and provide feedback on their progress. For instance, the AI-powered chatbot, NewsBot, developed by the University of Texas at Austin, engages users in conversations about media literacy, providing personalized feedback and resources (Mayer, 2021). These chatbots offer an innovative and interactive way to engage learners in media literacy education and provide them with the support they need to become critical consumers of media content.

The integration of AI in media literacy education initiatives profoundly impacts society. AI tools provide users with the resources and tools to fact-check information independently, empowering them to be critical consumers of media content. AI-powered platforms can promote responsible digital citizenship by encouraging users to share verified information and engage in civil discourse. Additionally, AI in media literacy curricula offers educators innovative ways to engage students and cater to individual learning styles. AI's ability to analyze vast amounts of data enables effective and efficient combatting of disinformation at scale.

Findings and Implications

Based on the critical analysis of AI and media literacy education's potential, this section will present the review's key findings. The implications of the findings for future research and policy development will be discussed, emphasizing the importance of interdisciplinary collaboration among educators, policymakers, and technologists.

This literature review has explored the definitions and classifications of misinformation, disinformation, and fake news, highlighting their real-world consequences and the approaches taken to address them. The review has provided case studies and examples that demonstrate the harm caused by these phenomena, such as the Pizzagate conspiracy theory, COVID-19 misinformation, and deepfake videos.

The key findings of this review suggest that the spread of false information can erode trust in media outlets and authoritative sources, foster polarized attitudes, and endanger public health efforts. The review emphasizes the importance of media literacy education, critical thinking, and ethical AI development to combat these phenomena.

Furthermore, the review underscores the need for interdisciplinary collaboration among educators, policymakers, and technologists. Educators can play a significant role in developing media literacy skills and critical thinking among students. Policymakers can enhance regulations and policies to combat the spread of false information. Technologists can develop AI tools to detect and flag false information while protecting user privacy.

Overall, the review's implications for future research and policy development emphasize collaboration among multiple disciplines to address the complex challenges of misinformation, disinformation, and fake news.

Call to Action

Drawing upon the insights gained from the review, this section will provide a call to action for various stakeholders, including educators, policymakers, tech companies, and civil society. It will underscore the urgency of integrating media literacy education into formal curricula and the need for responsible AI development to combat misinformation effectively. The call to action will emphasize the collective responsibility to foster a society that values critical thinking, media literacy, and ethical AI usage.

As we navigate the complex and evolving digital landscape, the need for media literacy education and responsible AI development has never been more urgent. We must work together as educators, policymakers, tech companies, and civil society to combat the harmful effects of misinformation, disinformation, and fake news. This literature review underscores the crucial role that media literacy education plays in empowering individuals to distinguish between fact and fiction and navigate the digital sphere critically. At the same time, we must prioritize responsible AI development to ensure that technology is not used to spread false information or manipulate public opinion. We are collectively responsible for fostering a society that values critical thinking, media literacy, and ethical AI usage. Let us take action now to create a more informed, responsible, and resilient society for ourselves and future generations.

Conclusion

Combating Misinformation and Fake News: The Potential of AI and Media Literacy Education
Jerry Washington

In conclusion, the contemporary digital landscape has seen an alarming rise in misinformation, disinformation, and fake news, causing significant harm to public discourse and societal well-being. The urgent need to address these phenomena through media literacy education, critical thinking, and ethical AI development cannot be overstated. This critical literary review has explored the potential of AI combined with media literacy education and practice in reducing the impact of misinformation, disinformation, and fake news on society. By comprehensively defining and classifying these phenomena, exploring their real-world consequences through case studies and examples, and highlighting the approaches researchers and practitioners have taken to address them, this review underscores the importance of continued research and collaboration to address the complex challenges of the digital information landscape. We must empower individuals to assess information and navigate the digital sphere critically, and further research and development of AI technologies can play a crucial role in achieving this goal.

Appendix

Conceptual Framework for the Intersection of Media Literacy Education and AI in Combatting Misinformation

Theoretical Perspective	Social Constructivist Approach to Learning
<i>Definition</i>	Knowledge is constructed through social interactions, and individuals actively construct meaning through experiences with the world.
<i>Application to Media Literacy Education</i>	Emphasizes the importance of media literacy education in equipping individuals with critical skills to navigate and interpret complex information environments.
<i>AI's Role in Media Literacy Education</i>	<i>Enhancing Effectiveness</i> AI can improve information retrieval, analysis, and verification in media literacy education.
<i>Benefits</i>	- Swift and accurate fact-checking and verification. - Personalized learning experiences tailored to individual needs.
<i>Ethical AI Development</i>	<i>Principles</i> Transparency, accountability, and user privacy are essential in AI development for media literacy education.
<i>Importance</i>	Ethical AI development ensures the responsible and socially beneficial use of AI in media literacy education.
<i>Interdisciplinary Collaboration</i>	Collaboration between media literacy educators and AI developers is crucial to develop responsible AI tools.
<i>Result</i>	Effective AI integration in media literacy education for combating misinformation.
<i>Synergistic Potential</i>	Combining media literacy education and AI empowers individuals and leverages AI capabilities to create a more informed and resilient society.
Methodology	Thematic Analysis Approach
<i>Data Collection</i>	Comprehensive search using academic databases and relevant keywords.
<i>Inclusion Criteria</i>	Relevance to media literacy education, AI, and misinformation; peer-reviewed articles published between 2015 and 2023.

Combating Misinformation and Fake News: The Potential of AI and Media Literacy Education
Jerry Washington

<i>Screening</i>	57 articles identified; 34 articles reviewed in full; 17 articles selected for analysis.
<i>Thematic Analysis</i>	Key themes identified, including nature of misinformation, media literacy education, Generative AI development, and ethical implications.
<i>Findings and Implications</i>	Media literacy education and AI are effective tools in combating misinformation. Interdisciplinary collaboration is essential for future research and policy development.
Misinformation, Disinformation, and Fake News	Definitions and Classifications
<i>Definition</i>	Misinformation: Inaccurate or false information shared unintentionally. Disinformation: Deliberately spreading false or misleading information to deceive. Fake News: Intentionally fabricated information presented as legitimate news.
<i>Case Studies and Examples</i>	Pizzagate conspiracy theory, COVID-19 misinformation, deepfake videos.
<i>Harm and Influence</i>	Eroding public trust, fostering polarization, endangering public health, impacting policy decisions, influencing election outcomes, and causing economic consequences.
<i>Approaches to Address</i>	Media literacy education, critical thinking, fact-checking tools, social media platform interventions, and AI-powered solutions.
Media Literacy Education and Practice	Significance and Impact
<i>Importance</i>	Media literacy education fosters informed and engaged citizens.
<i>Existing Programs</i>	News Literacy Project, MediaWise, and their impact on media consumers' ability to resist misinformation.
Generative AI Development and Ethical Implications	AI and Misinformation
<i>Generative AI</i>	AI capable of generating content based on patterns and data from existing content.
<i>Ethical Concerns</i>	AI can generate fake news, perpetuate biases, and disseminate misleading information.

The Synergy of AI and Media Literacy Education	AI-Driven Tools
<i>AI Tools for Detection</i>	Fact-checking algorithms, NewsGuard, AI-driven fact-checking bots.
<i>Verifying Authenticity</i>	AI tools assessing source credibility and media bias.
<i>Personalization</i>	AI tailors media literacy education to individual learners.
<i>Impact</i>	AI tools empower users with fact-checking abilities, promote digital citizenship, and improve media literacy learning experiences.
Findings and Implications	Interdisciplinary Collaboration
<i>Key Findings</i>	Media literacy education and AI technologies hold great potential in combatting misinformation.
<i>Implications</i>	Interdisciplinary collaboration is necessary among educators, policymakers, and technologists to effectively address misinformation's challenges.
Call to Action	Fostering a Resilient Society
<i>Role of Stakeholders</i>	Educators, policymakers, tech companies, and civil society must collaborate to combat misinformation.
<i>Integration of Media Literacy Education</i>	Media literacy education should be integrated into formal curricula.
<i>Responsible AI Development</i>	AI technologies should be developed and used responsibly to prevent the spread of misinformation.
<i>Urgency</i>	The call to action emphasizes the urgency to act now to create a more informed, responsible, and resilient society.
Conclusion	The review underscores the need for media literacy education and responsible AI development in combatting misinformation. It highlights the importance of interdisciplinary collaboration, critical thinking, media literacy, and ethical AI usage in fostering an informed society.
